

## Engineering Economics v1.0

This is a program that I have pulled off of the shelf so-to-speak. It has been several years since I have had this class and since I have used the program. The program is very self-explanatory requiring only for you to utilize the F1-F5 keys for navigation. Selecting the MORE key in many cases will show you additional options. In most functions with the exception of the more complex gradient problems, entering zero will signify which answer you are trying to find, and Econ will then solve for that answer. Look around and get a feel for where things are located and I promise you will not be sorry come test time.

If you find a bug or a miscalculation in the program please contact me at [ganoel@hotmail.com](mailto:ganoel@hotmail.com) with a detailed description of what you entered, all the answers you were given, and the correct basic formula for what you are trying to find. Don't worry about the simplified version; just give me whatever is in your textbook.

Enjoy and let me know if it helps.....
